

# The Economic Contribution of Agriculture and Forestry Production and Processing in Mississippi: *An Input-Output Analysis*

---

Agriculture and forestry are major contributors to Mississippi's economy. In 2012 alone, agriculture and forestry production and processing sectors directly accounted for 118,075 jobs paying \$3.2 billion in wages and salaries (**Table 1**). In addition, agriculture and forestry-related sectors directly accounted for \$27.7 billion in sales and generated \$6.3 billion in value-added products. Clearly, agriculture and forestry provide a major contribution to the Mississippi economy. Yet that contribution has a much larger impact on the Mississippi economy than just the direct impacts of agriculture and forestry previously described. A larger total impact results when accounting for the indirect and induced effects of the agriculture and forestry industry and employee spending. This report provides an estimate of the economic impacts of agriculture and forestry using the most recent data available on production (e.g., farms, timber stands), primary processing activities (e.g., cotton ginning, paper mills), and value-added products (e.g., snack food manufacturing, stationery product manufacturing). This report focuses on the total economic impact of agriculture and forest activities on employment and income.

## Methods

The total economic impact is the sum of direct effects, indirect effects, and induced effects. Direct effects represent the economic activity from businesses defined as belonging in agriculture (i.e., producers, processors, and agricultural support services). Indirect effects represent the economic activity from businesses and organizations not traditionally thought of as agriculture-related (e.g., education, information, and

insurance), though they may supply goods and services to agricultural businesses. Indirect effects are a basic response to agricultural activities and reflect the interdependence between businesses and industries throughout the economy. Induced effects simply reflect spending by households as a result of direct and indirect effects.

Data for the direct effects and estimation of the indirect and induced effects came from a well-known input-output modeling system called Impact for Planning and Analysis, or IMPLAN, which is updated annually by the IMPLAN Group LLC (MIG 2010). IMPLAN is a computerized database and modeling system for constructing regional economic accounts and regional input-output tables. The IMPLAN 440 sector input-output model is based primarily on data from the U.S. Bureau of Economic Analysis, U.S. Bureau of Labor Statistics, U.S. Census Bureau, U.S. Department of Agriculture, and U.S. Geological Survey. The most recent 2012 IMPLAN data were used for this study.

The IMPLAN model was used to estimate the total economic contribution of agriculture and forestry (i.e., direct, indirect, and induced). The estimation approach followed that of IMPLAN Group LLC for assessing the economic contribution of an industry. Results indicate the industries that benefit the most from the economic contribution of agriculture and forestry.

This study combines the 440 sectors of the IMPLAN database into 32 aggregated sectors—13 agriculture and forestry sectors and 19 sectors representing the rest of the Mississippi economy (**Table A.1**). This procedure was used by Barnett and Reinschmidt (1996), who modeled the Mississippi econ-

omy using 45 aggregated sectors—26 food and fiber sectors and 18 non-food and non-fiber sectors. These are the 13 agriculture and forestry production and processing sector groups:

- agriculture support activities
- cattle and dairy
- commercial fishing and wildlife
- cotton farms
- food and fiber products
- grain farms
- logging
- other animal production (hogs, horses, aquaculture)
- other farms (vegetable and melon)
- poultry
- soybean farms
- wood and paper products
- wood furniture manufacturing

The economic contribution of agriculture and forestry-related sectors to Mississippi can be measured by employment, employee compensation, output, and value-added. Employment is simply the number of full- and part-time jobs. Employee compensation is the wages paid. Output is the total value of goods and services produced. Value-added is the total value of goods and services produced minus the costs of purchased inputs. Value-added is the amount of money available for disbursement, either in the form of wages, owner compensation, or taxes.

## Results

The combined economic contribution of the agriculture and forestry production and processing sectors had a substantial effect on the Mississippi economy as measured by jobs, employee compensation, total output, and value-added (**Table 2**). Employment is the annual average number of full-time and part-time jobs in the private and public sectors. This measure represents people employed for wages as well as those who are self-employed. Agricultural and forestry activities contributed to an estimated total employment impact of 274,250 jobs in the state, or about 18.3 percent of all jobs in Mississippi. Employee compensation is the annual monetary wages and salaries paid to employ-

ees and self-employed people, and it includes the value of benefits. Agricultural and forestry activities contributed an estimated \$8.8 billion in labor income (16 percent of state labor income). Output represents the total gross sales for goods and services throughout the state. In 2012, agriculture and forestry activities, including production and processing, directly and indirectly accounted for \$46 billion in output, or 20.6 percent of all economic activity in Mississippi. Value-added is the residual value of a sector's outputs after it pays for its inputs. This performance measure avoids double counting the value of an output from one sector that is used as an input in another sector. A sector's value-added is distributed as wages and salaries, rental payments, royalties from contracts, dividends from corporations, corporate profits, or indirect business taxes (such as property taxes, excise taxes, and sales taxes). In 2012, agriculture and forestry activities contributed \$18.1 billion in value-added, or 16.8 percent of all value-added generated in the state.

## Summary

Agriculture and forestry production and processing is a \$46 billion dollar industry in Mississippi. These production and processing industries provide a major economic contribution to the Mississippi economy, accounting for 274,250 jobs, or 18.3 percent of all jobs in the state; \$8.8 billion in labor income, or 16.0 percent of the state's total wages and salaries; \$46 billion in goods and services, or 20.6 percent of all sales; and \$18.1 billion in value-added, or 16.8 percent of Mississippi's total value-added. Clearly, agriculture and forestry are important to Mississippi's economy.
